

Introduction

This project focuses on cleaning and preprocessing raw data using Python. Data cleaning is an essential step because real-world data is often incomplete and inconsistent.

Objective

The main objective is to prepare the dataset for analysis by handling missing values, removing duplicates, and improving data quality.

Tools Used

Python is used along with Pandas and NumPy libraries. Jupyter Notebook is used for executing the code step by step.

Process

The dataset is loaded, explored, and cleaned. Missing values are handled, duplicates are removed, and columns are formatted properly.

Data Transformation

Data types are converted, unnecessary columns are removed, and new columns are created when needed.

Results

The final dataset becomes clean, structured, and ready for analysis or machine learning tasks.

Conclusion

This project highlights the importance of data cleaning in data science. Clean data leads to better insights and accurate results.
